Perfect Pizza: Context Level Diagram

This diagram shows the flow of data within the Registry Plus suite of publicly available free software programs. The bundles of raw electronic cancer abstracts are processed in eMaRC Plus, Abstract Plus, or Web Plus to prepare the data for importing and storage in the central database. Central Registry System (CRS) Plus is the software application housing the central database. Prep Plus, a program for the central registry that receives North American Association of Central Cancer Registries (NAACCR)-formatted abstracts from Abstract Plus, eMaRC, Web Plus, or any hospital-based software that can produce the NAACCR record format, receives these bundles and prepares them for incorporation into the central database. Prep Plus keeps archives of these bundles as they are processed. Prep Plus allows some abstracts to be held for review by other users and records the status of each abstract in the tracking database as it is processed. Processed abstracts are released from Prep Plus in bundles which are imported into CRS Plus. CRS Plus stores the bundles of abstracts in a Microsoft® SQL Server database. The CRS Plus software is the Registry Plus application used to manage the central registry database. The program provides for automatic determination of multiple primary tumors and consolidation of data items from multiple abstracts into incidence records. Several reports run from the database, which also allows data to be queried and extracted for NAACCR and NPCR submissions. It should be noted that Prep Plus and CRS Plus must be used together, while the other Registry Plus programs can be used independently. Linkage software can be used to compare extracts created from the CRS Plus database to records generated from eMaRC Plus and Data File Mapper Plus or from external data sources such as state death files or the National Death Index to produce linkage reports. The results from the linkages can be written to the CRS Plus database using SQL Server Management Studio to populate data items and to supplement cancer data. Data File Mapper Plus is a mapping application that creates NAACCR-formatted records from various data sources. Other applications in the Registry Plus suite include: Tools for editing cancer data: GenEDITS Plus: a batch-mode application for editing any standard cancer data file including XML with any metafile. Edit Writer: Complete development environment for defining, testing, documenting, and distributing data standard edits. Edit Engine Library: Application Program Interface (API) that can be incorporated into many kinds of programs including applications for abstracting, data verification, recoding, and reformatting. XMLExchange Plus: a tool for working with NAACCR data exchange files formatted according to the NAACCR XML Data Exchange Standard Implementation Guide. NPCR utilities, including the NorthCon Record Converter which converts files of cancer registry abstracts in the NAACCR format to updated NAACCR versions. Data Flow to the Registry Plus Suite By Contributing Writer Updated July 21, 2017 i computers network image by Orlando Florin Rosu from Fotolia.com A data processing system takes raw data and, through the power of computer automation, produces information that a set of program applications has validated. Information includes text, arithmetic calculations, formulas and various other types of information and data based on the computer system. A data processing system is also called an automated data processing (ADP) unit or an electronic data processing (EDP) unit. HistoryThe first data processing system was developed by IBM. The IBM 701 Data Processing Machine was designed to handle the concept of multitasking, which brought the power of automation to small businesses and organizations. According to MIS magazine, the 701 opened the door for the concept of management information systems and specialized software packages for various industries.FeaturesIn simplistic terms, a data processing system uses a software application to accept input from a user to create a form of output. Output is generated on devices classified as peripherals. Peripherals are printers, external media storage devices, monitors, hard drives, and disk and tape systems and, currently, flash disk drives. Data processing systems in large organizations can consist of a diverse group of computers processing information at the same time. Data processing systems allow users to multitask or operate two software applications during the same computer session. BenefitsThere are several benefits of a data processing system. The number one benefit is speed. A data processing system can process data measured in billionths and trillionths of a second. A data processing system can carry out a sequence of program instructions without human interference or interaction. Instructions from program implementation are stored in ROM (read only memory) and can be accessed by the system to process a particular program. Another benefit is the storage capacity of a data processing unit, which can store thousands of files and is only limited by the size of the storage disk inside the unit. Career OpportunitiesWhen data processing became a vital element to business and government organization, it provided jobs for individuals to maintain the data system. As the technology in data processing evolved, so did the demand for data processing specialists. Today, data processing has evolved into bigger, faster and more complex systems.Future of Data ProcessingThe future of data processing has evolved to the Internet. Companies can set up data modules on their website for employees and clients to input information and, through the website, receive results. The next wave of data processing will include text-to-disk entry of data over the Internet and remote processing of data from anywhere in the world. Also, the physical size of computers to process data is getting smaller. By Chron Contributor Updated July 10, 2020 Payroll is an important part of a company's processes because it's how employees get their paychecks. If it's not done correctly, employees may not get paid on time. While outsourcing payroll has grown dramatically in recent years, according to Entrepreneur.com, it's still important to learn how to handle payroll yourself. Developing a payroll system flow chart helps to streamline the process and illustrates from start to finish exactly how checks are written and distributed. Think of your flow chart as a cheat sheet: The chart should cover both manual and automatic payroll processes unique to your company's payroll system. According to Business.com, the best place to start is by prioritizing the most important information on the flow chart. To do this, outline the high points beginning with how amounts are determined through delivery to employees. Include information about collecting time cards, entering hours worked and calculating gross and net pay. Also include how checks are produced and delivered. After the first step is completed, go back to the beginning of your flow chart and determine what secondary functions need to be added. This could include adding a new employee or what happens if a change needs to be made in payroll. Depending on your payroll system, there may be functions that are done automatically, such as calculating the amount of tax deductions, that should need to be included. Add these functions into the chart at appropriate stages, such as putting calculating deductions after figuring total income for the period. You'll want to add detail to your steps from here. Once you have a complete outline of the steps of your payroll process, you need to flesh out details on how to do them on your flow chart. Under each manual function, describe how each one is completed. Steps that are done automatically should have a notation that explains they are done by the computerized system without manual input. If the step is completed by an outsourced payroll company, you should also note that. Now's the time to assign a role to each step. Include who in your company is responsible for each function. For instance, the payroll manager may need to approve new employees before they are added to the system. The CEO may be responsible for approving payroll before it is distributed. The CFO may need to sign checks. Anywhere that a specific person is responsible for a step in the payroll process, note that person's title, name or both beside the step on your flow chart. You can divide payroll into two flow charts, one for manual process and one for automatic ones. You may also want to make a less detailed flow chart for management and the more detailed one for payroll employees. Characteristics of Strategic Information...
